SUMMARY

Unity developer with 8+ years shipping mobile games, WebGL and XR training apps. I have taken projects from a rough brief through scoping, build and store release, on Android, iOS and WebGL. Most of my recent work is XR and UI/UX engineering, including running client projects end to end for US clients at Aptara. Before that, nearly four years at GodSpeed Games across published titles on Google Play and Steam. I am equally happy writing gameplay code, chasing down a frame time problem, or being the person the client talks to.

PROFESSIONAL EXPERIENCE

Senior Unity UI/UX Game Engineer

Jun 2026 - Present

GameFuel

Remote

- Work on the UI and UX layer of a fantasy sports title for a major international game publisher, currently in early access, alongside the wider dev team.
- Implement UI screens, transitions and animations to the client's model view composer UI framework, covering team creation, contest entry and live score and player performance views.
- Work from Figma handoffs, turning designs and exported assets into responsive Unity layouts that hold up across phone and tablet aspect ratios.

Freelance Unity Developer

Mar 2025 - Jun 2026

Fiverr and direct clients

Pune, India

- Delivered Unity contracts for international clients across mobile games, WebGL and XR, sourced both through Fiverr and directly, handling scoping, estimates, delivery and revisions myself.
- Hold a 5.0 star rating across 65 reviews, with several clients on ongoing collaborations rather than one off jobs. Most of that came from turning vague briefs into a fixed scope they could sign off on.

Senior Developer (Lead)

Aug 2023 - Mar 2025

Aptara

Pune, India

- Led XR Unity projects for US based clients across three consecutive builds, owning scoping, estimates and final delivery on each.
- Acted as the direct technical contact for clients: worked through their queries, analysed what they actually needed behind the request, and came back with a proposed approach and the trade offs rather than just a quote.
- Sat at the centre of a distributed team: instructional designers, 2D and 3D artists, developers in both India and the US, client side technical teams and project managers. Most of the job was translating between what the client asked for, what design had specified and what was actually buildable, and keeping handoffs moving across time zones.
- **Expert Path VR:** led a VR simulation where technicians rehearse real customer conversations. Built the modular dialogue system and NPC animation work, deployed to Meta Quest.
- **Fire Extinguisher WebGL:** led an in browser fire safety trainer, covering the WebGL and WebVR build, the state machine driving each procedure step, NPC animations and the first person controller.
- **Fiber Network AR:** AR training app for field technicians, built on AR Foundation with a modular lesson system and voiceover, shipped to both Android and iOS.
- Introduced code review and a shared set of coding standards, which cut the back and forth on handoffs between developers.
- Profiled and optimised builds for standalone Quest hardware and for in browser delivery.

Senior Programmer

Aug 2019 - May 2023

GodSpeed Games

Pune, India

Progressed through Junior Programmer, Programmer Level 2, Associate Senior Programmer and Senior Programmer.

- **Snakes & Ladders 3D (10M+ downloads):** gameplay implementation, FSM driven AI, Photon multiplayer networking and the level design tooling for the team.
- **GodSpeed Cricket League (1M+ downloads):** FSM based AI, motion capture animation integration, UI, the cinematic camera system and a custom shader.
- **Kitty Coloring Book for Kids** and **Coloring Games for Kids:** built the colouring engine behind both titles as a reusable plugin, so later colouring games were assembled on top of it instead of rebuilding the fill and brush logic each time. Both released on Google Play, 1M+ downloads combined.

- **Plan B From Outer Space:** implemented full gamepad support using the Rewired input plugin.
- **Prototypes:** Super Climber (climbing mechanics, Spine animation, level editor), Polishing Game (modular cleaning system using command buffers and custom shaders) and an unwrapping game built on mesh cutting with Delaunay triangulation.
- **Farm Sim (PC and console, unreleased):** built the full game AI on behaviour trees, plus a dynamic snow shader, Addressables asset loading and Rewired input support. Shelved before release.
- **Editor tooling:** built the tools the team worked in day to day. A visual behaviour tree editor on xNode with a custom graph view for authoring AI, and a reflection driven debug console and settings menu that could be dropped into any project.
- Led a team of 3 junior and fresher developers on the farm sim project, handling task breakdown, code review and the technical side of their onboarding.

Freelance Unity Developer

Feb 2018 - Aug 2019

Fiverr

Pune, India

- Took on short Unity contracts for clients on Fiverr: gameplay features, bug fixes, prototype builds and Android release setup.
- The variety pushed me across a lot of Unity quickly, from UI and physics to animation and platform builds, and taught me to scope and quote my own work early on.

Unity Developer Intern

Jun 2017 - Feb 2018

Ethosh Designs

Pune, India

- Carried the same delivery brief as the full time developers on live client VR and AR projects, taking features from spec through to handover while finishing my degree.
- **Navy Ship Training:** VR safety trainer for Oculus Rift and Vive, built on state machine driven modules with Mecanim animation.
- **Safety Training:** AR application for workplace safety procedures, built around interactive step by step walkthroughs.

SKILLS

Engine and language: Unity (URP, Addressables, Mecanim, xNode, UI Toolkit, uGUI), C#

XR: Meta Quest, Oculus Rift, Vive, AR Foundation, ARCore, Vuforia, WebVR

Gameplay and graphics: shader development (Cg/HLSL, Shader Graph), Photon multiplayer, game AI (behaviour trees, FSMs, GOAP), physics, animation systems, performance profiling

Platforms: Android, iOS, WebGL, Windows

Workflow: Git, GitHub Actions, Azure DevOps, Jira, Confluence

Tooling and services: Visual Studio, Figma (design handoff), Firebase, Rewired, Blender, Substance 3D

EDUCATION

Bachelor of Computer Applications, CHRIST College

2014 - 2018

INTERESTS

- **AI tooling for game art pipelines.** I build my own tools around AI generated 3D: a Blender addon that retopologises AI meshes into game ready low poly with baked maps, and custom MCP servers that drive Blender, Unity and Houdini from Claude Code. Mostly to find out where the generated asset workflow actually breaks.
- Prototyping small games, cricket, and esports.
